

Benefits of COVID Vaccination in Children

Pfizer/BioNTech Vaccine data:

- Safe and well-tolerated.
- Vaccine generated a robust immune response in children 5 to 11 years in big clinical trial.
- Vaccine generated levels of antibodies that were similar to those of younger adults.
- Fewer side effects such as fever and chills among younger children who got the vaccine compared with 16-to-25-year-olds, according to Pfizer.
- No cases of myocarditis, an inflammatory heart condition that has so far been found to be a rare side effect primarily in young men.
- No cases of severe COVID-19 No cases of MIS-C
